

Step	Action
1: Setup & Pivot Table Creation	Open Excel → Load dataset → Understand analysis objective → Identify important columns → Select complete dataset → Insert → Pivot Table → Select full table range → Choose "New Worksheet" → Click OK
2: Basic Pivot Table Structure	Drag category/group field into Rows Area → Drag sub-category/detail field below it in Rows Area → Drag numerical field into Values Area → Open Value Field Settings → Select calculation method (Sum/Average/Count etc.) → Format values if needed
3: Hierarchical & Trend Analysis	Expand/collapse hierarchy → Sort values Largest → Smallest → Identify top-performing groups → Compare trends across groups → Analyze matrix/hierarchical structure → Observe patterns and relationships
4: Conditional Formatting	Apply Conditional Formatting → Use color scales → Highlight trends/exceptions → Identify unusually high/low values visually → Compare performance through formatting cues
5: Multi-Variable Pivot Analysis	Create another Pivot Table if required → Drag primary category into Rows Area → Drag secondary category into Columns Area → Drag numerical field into Values Area → Analyze multivariable/hierarchical data → Sort Pivot values → Compare categories/groups
6: Filtering & Slicers	Drag filtering field into Filters Area → Filter specific groups/categories → Select multiple filter values if required → Insert Slicers → Use Ctrl for multiple slicer selections → Observe automatic Pivot updates → Use Filters for reports → Use Slicers for dashboards/visual interfaces
7: Observation & Business Analysis	Identify top-performing groups → Identify least-performing groups → Compare performance across categories → Analyze anomalies/patterns → Form observations and business hypotheses from trends
8: VLOOKUP Setup	Open second table/file → Ensure common key column exists → Ensure lookup column is first column in target table → Start VLOOKUP formula
9: VLOOKUP Execution	Enter Lookup Value → Select Table Array → Enter Column Index Number → Use FALSE for exact match → Use Dollar Signs for fixed references → Use Named References for cleaner formulas → Keep linked files in same directory if using external files
10: Error Handling & Formula Debugging	Check for #N/A or reference errors → Go to Formula Tab → Use Evaluate Formula → Use Error Checking → Use Show Formulas → Correct incorrect references/formulas
11: Navigation & Productivity	Use Ctrl + F for searching → Use Ctrl + Arrow Keys for navigation → Use Shift + Ctrl + Arrow Keys for large selections → Use Ctrl + Z to undo → Use Ctrl + Y to redo → Save frequently (Ctrl + S)
12: Final Review	Review Pivot Tables, formatting, filters, and insights → Validate calculations and observations → Save final analysis report (Ctrl + S)
